CBSE Class 10 Geography Notes Chapter - 6 Manufacturing Industries

CBSE Class 10 Geography Notes

CBSE Class 10 Geography Notes Chapter – 6 Manufacturing Industries

- **Importance of Manufacturing**

(i) Manufacturing industries not only help in modernising agriculture, which forms the backbone of our economy, they also reduce the heavy dependence of people on agricultural income by providing them jobs in secondary and tertiary sectors.

(ii) Industrial development is a precondition for eradication of unemployment and poverty from our country. This was the main philosophy behind public sector industries and joint sector ventures in

India. It was also aimed at bringing down regional disparities by establishing industries in tribal and backward areas.

(iii) Export of manufactured goods expands trade and commerce, and brings in much needed foreign exchange.

(iv) Countries that transform their raw materials into a wide variety of finished goods of higher value are prosperous. India's prosperity lies in increasing and diversifying its manufacturing industries as quickly as possible.

- **Agriculture and Industry**

(i) Agriculture and industry are not exclusive of each other. They move hand in hand.

(ii) For instance, the agro-industries in India have given a major boost to agriculture by raising its productivity

(iii) They depend on the latter for raw materials and sell their products such as irrigation pumps, fertilisers, insecticides, pesticides, plastic and PVC pipes, machines and tools, etc. to the farmers

(iv) Thus, development and competitiveness of manufacturing industry has not only assisted agriculturists in increasing their production but also made the production processes very efficient

- **Industrial Location**

(i) Industrial locations are complex in nature. These are influenced by availability of raw material,labour, capital, power and market, etc.

(ii) It is rarely possible to find all these factors available at one place. Consequently, manufacturingactivity tends to locate at the most appropriate place where all the factors of industrial location are either available or can be arranged at lower cost. After an industrial activity starts. urbanisation follows.

(iii) Industrialisation and urbanisation go hand in hand. Cities provide markets and also provide Services such as banking, insurance, transport, labour, consultants and financial advice, etc. to the industry

(iv) Many industries tend to come together to make use of the advantages offered by the urban centres known as **agglomeration economies**.

- **Agro-based Industries**

Cotton, jute, silk, woollen textiles, sugar and edible oil, etc. industries are based on agricultural raw materials

(i) Textile Industry: The textile industry occupies unique position in the Indian economy, because it contributes significantly to industrial production, employment generation and foreignexchange earnings.

(ii) Cotton Textiles: In ancient India, cotton textiles were produced with hand spinning and handloom weaving techniques. After the 18th century, power-looms came into use.

(a) Our traditional industries suffered a setback during the colonial period because they couldnot compete with the mill-made cloth from England.

(b) This industry has close links with agriculture and provides a living to farmers, cotton bollpluckers and workers engaged in ginning, spinning, weaving, dyeing, designing, packagingtailoring and sewing.

(c) The industry by creating demands supports many other industries, such as, chemicalsand dyes, packaging materials and engineering works.

- **Mineral-based Industries**

Industries that use minerals and metals as raw materials are called mineral-based industries.

(i) Iron and Steel Industry

(a) The iron and steel industry is the basic industry since all the other industries – heavy,medium and light, depend on it for their machinery

(b) Steel is needed to manufacture a variety of engineering goods, construction materialdefence, medical, telephonic, scientific equipment and a variety of consumer goods.

(c) Production and consumption of steel is often regarded as the index of a country'sdevelopment

(d) Iron and steel is a heavy industry because all the raw materials as well as finished goodsare heavy and bulky entailing heavy transportation costs.

(ii)Aluminium Smelting

(a) Aluminium smelting is the second most important metallurgical industry in India. It islight, resistant to corrosion, a good conductor of heat, malleable and becomes strongwhen it is mixed with other metals.

(b) It is used to manufacture aircraft, utensils and wires. It has gained popularity as asubstitute of steel, copper, zinc and lead in a number of industries.

(iii) Chemical Industries

(a) The Chemical industry in India is fast growing and diversifying. It comprises both largeand small scale manufacturing units.

(b) Rapid growth has been recorded in both inorganic and organic sectors.

(c) The chemical industry is its own largest consumer. Basic chemicals undergo processing to further produce other chemicals that are used for industrial application, agriculture or directly for consumer markets.

(iv) Fertiliser Industry

(a) Fertilizer Industry The fertilizer industry is centred around the production of nitrogenous fertilizers (mainly urea), phosphatic fertilizers and ammonium phosphate (DAP) and complex fertilizers which have a combination of nitrogen (N), phosphate (P), and potash (K)

(b) After the Green Revolution the industry expanded to several other parts of the country.

(v) Cement Industry

(a) Cement Industry Cement is essential for construction activity such as building housesfactories, bridges, roads, airports, dams and for

other commercial establishments

(b) This industry requires bulky and heavy raw materials like limestone, silica and gypsum.Coal and electric power are needed apart from rail transportation,

(vi) Automobile Industry

Automobiles provide vehicle for quick transport of good services and passengers. Trucks, buses, cars, motor cycles, scooters, three-wheelers and multi-utility vehicles are manufactured in India at various centres.

(vii) Electronics Industry

(a) The electronics industry covers a wide range of products from transistor sets to television,telephones, cellular telecom, telephone exchange, radars, computers and many other equipments required by the telecommunication industry, Bengaluru has emerged as theelectronic capital of India.

(b) This industry has been a major foreign exchange earner in the last two or three yearsbecause of its fast growing Business Processes Outsourcing (BPO) sector. The continuing growth in the hardware and software is the key to the success of IT industry in India.

- **Industrial Pollution and Environmental Degradation**

(i) Although industries contribute significantly to India's economic growth and development, theincrease in pollution of land, water, air, noise and resulting degradation of environment thatthey have caused, cannot be overlooked

(ii) Industries are responsible for four types of pollution: (a) Air (b) Water (c) Land (d) Noise. Thepolluting industries also include thermal power plants.

- **Control of Environmental Degradation**

Every litre of waste water discharged by our industry pollutes eight times the quantity of freshwater Following are a few suggestions through which industrial pollution of fresh water could be reduced:

(i) Minimising use water for processing by reusing and recycling it in two or more successivestages.

(ii) Harvesting of rainwater to meet water requirements.

(iii) Treating hot water and effluents before releasing them in rivers and ponds. Treatment ofindustrial effluents can be done in three phases.

(a) Primary treatment by mechanical means. This involves screening, grinding, flocculationand sedimentation.

(b) Secondary treatment by biological process

(c) Tertiary treatment by biological, chemical and physical processes. This involves recyclingof wastewater

IMPORTANT TERMS

- **Agro-industry:** Agriculture developed along industrial lines.
- **Agglomeration:** A mass or collection of things, an assemblage,
- **GDP:** Gross Domestic Product – the monetary total value of finished goods produced and services provided in a country during one year.
- **Urbanisation:** refers to the population shift from rural to urban areas, 'the gradual increase in the proportion of people living in urban areas', and the ways in which each society adapts to the change.
- **Industrialisation:** The development of industries in a country or region on a wide scale.
- Public Sector Industries is the part of the economy concerned with providing various governmental services. The composition of the public sector varies country wise, but in most countries, the public sector includes such services as the military, police, infrastructure (public roads, bridges, tunnels, water supply, sewers, electrical grids, telecommunications, etc.), public transport, public education, along with health care and those working for the government itself, such as elected officials.
- Private Sector Industries is the part of the economy, sometimes referred to as the citizen Sector, which is run by private individuals or groups, usually

as a means of enterprise for profit, and is not controlled by the State (areas of the economy, controlled by the state being referred to as the public sector).

- Mineral based Industries: Industries that use minerals as raw material are called mineral-based industries. The iron and steel industry is the basic industry on which all other industries depend. The production and per capita consumption of steel is a measure of a country's economic development.
- Natural Product: A natural product is a chemical compound or substance produced by a living organism-that is, found in nature. In the broadest sense, natural products include any substance produced by life.
- Aluminium Smelting is the process of extracting aluminium from its oxide, alumina, generally by the Hall-Héroult process. Alumina is extracted from the ore 'bauxite' by means of the Bayer process at an alumina refinery. Aluminium smelting is the second most important metallurgical industry in India.
- Fertilizer Industry or fertiliser is any material of natural or synthetic origin (other than liming materials) that is applied to soils or to plant tissues (usually leaves) to supply one or more plant nutrients essential to the growth of plants.
- Environmental Degradation is the deterioration of the environment through depletion of resources such as air, water and soil; the destruction of ecosystems; habitat destruction; the extinction of wildlife; and pollution.
