Class 7 Science NCERT Solutions in English Chapter – 2 Nutrition in Animal

- Post category:Class 7 Science NCERT Solution In English

Here we are providing **Class 7 Science NCERT Solutions in English** Chapter – 2 Nutrition in Animal include all questions presented in the NCERT Science Class 7 books. Candidates can enlist the help of the NCERT Science Class 7 solutions in English on the next page and gain a deeper understanding of the concepts. NCERT Class 7 Science NCERT Solutions in English Chapter – 2 Nutrition in Animal Class 7 Science NCERT Solutions in English Chapter – 2 Nutrition in Animal is designed by our team of subject matter experts to help students prepare for exams. English students can view the PDF of the NCERT Class 7 Science Solutions on the page below. From the NCERT Science Book English Questions and Answers on this page, students will learn how to correctly solve NCERT problems.

Remember that the NCERT Class 7 Science Book Solution is the best resource for a good study of the 18 chapters. Use the NCERT Class 7 Science Book Solution as a reference and keep practicing with the answers to questions and exercises until you improve your answers to all chapters of your Class 7 Science Program. Class 7 Science NCERT Solutions in English Chapter – 2 Nutrition in Animal will help you solve all NCERT Class 7 Science questions chapter 2 smoothly. if you want more notes for various subject then **click here**

Class 7 Science NCERT Solutions in English Chapter – 2 Nutrition in Animal

Q 1:

Fill in the blanks:

(a) The main steps of nutrition in humans are _____, _____, _____, ____ and_____.

(b) The largest gland in the human body is _____.

(c) The stomach releases hydrochloric acid and _____ juices which act on food.

(d) The inner wall of the small intestine has many finger-like outgrowths called _____.

(e) Amoeba digests its food in the _____.

Ans 1:

(a) The main steps of nutrition in humans are ingestion, digestion, absorption, assimilation and egestion.

(b) The largest gland in the human body is liver.

(c) The stomach releases hydrochloric acid and digestive juices which act on food.

(d) The inner wall of the small intestine has many finger-like outgrowths called villi.

(e) Amoeba digests its food in the food vacuole.

Q 2:

Mark (T) if the statement is true and (F) if it is false:

(a) Digestion of starch starts in the stomach. (T/F)

(b) The tongue helps in mixing food with saliva. (T/F)

(c) The gall bladder temporarily stores bile. (T/F)

(d) The ruminants bring back swallowed grass into their mouth and chew it for some time. (T/F)

Ans 2:

(a) Digestion of starch starts in the stomach. (False)

(b) The tongue helps in mixing food with saliva. (True)

(c) The gall bladder temporarily stores bile. (True)

(d) The ruminants bring back swallowed grass into their mouth and chew it for some

time. (True)

Q 3:

Tick (√) mark the correct Ans in each of the following:

(a) Fat is completely digested in the

(i) stomach (ii) mouth (iii) small intestine (iv) large intestine

(b) Water from the undigested food is absorbed mainly in the

(i) stomach (ii) food pipe (iii) small intestine (iv) large intestine

Ans 3:

(a) Fat is completely digested in the (iii) small intestine √

(b) Water from the undigested food is absorbed mainly in the (iv) large intestine √

Q 4:

Match the items of Column I with those given in Column II:

Column I	**Column II**
Food components	Product(s) of digestion

Carbohydrates	Fatty acids and glycerol
Proteins	Sugar
Fats	Amino acids

Ans 4:

Column I	**Column II**
Food components	Product(s) of digestion
Carbohydrates	Sugar
Proteins	Amino acids
Fats	Fatty acids and glycerol

Q 5:

What are villi? What is their location and function?

Ans 5:

The inner walls of the small intestine have thousands of finger-like outgrowths. These are called villi (singular villus). The villi increase the surface area for absorption of the digested food. Each villus has a network of thin and small blood vessels close to its surface. The surface of the villi absorbs the digested food materials.

Q 6:

Where is the bile produced? Which component of the food does it help to digest?

Ans 6:

Liver (the largest gland in human body) secretes bile juice that is stored in a sac called

the gall bladder. The bile helps in the digestion of fats.

Q 7:

Name the type of carbohydrate that can be digested by ruminants but not by humans. Give the reason also.

Ans 7:

Cellulose (a type of carbohydrate) can be digested by ruminants but not by humans because ruminants have a large sac-like structure called rumen between the oesophagus and the small intestine. The cellulose of the food is digested here by the action of certain bacteria which are not present in humans.

Q 8:

Why do we get instant energy from glucose?

Ans 8:

In the cells, glucose breaks down with the help of oxygen into carbon dioxide and water, and energy is released.

Q 9:

Which part of the digestive canal is involved in:

(i) absorption of food _____.

(ii) chewing of food _____.

(iii) killing of bacteria _____.

(iv) complete digestion of food _____.

(v) formation of faeces _____.

Ans 9:

(i) absorption of food small intestine.

(ii) chewing of food buccal cavity (Mouth).

(iii) killing of bacteria stomach.

(iv) complete digestion of food small intestine.

(v) formation of faeces large intestine.

Q 10:

Write one similarity and one difference between the nutrition in amoeba and human beings.

Ans 10:

Similarity :- The basic process of digestion of food and release of energy is the same in amoeba as well as in human beings. In amoeba, Digestive juices are secreted into the food vacuole. They act on the food and break it down into simpler substances. Gradually the digested food is absorbed. Similarly, in human beings various digestive juices (mouth, stomach, intestine etc.) act on food and break it down to simpler substances.

Difference :- The digestion process in amoeba is simple while in human beings it is a complex process. The process of ingestion and egestion are also quite different. Amoeba engulf its food by surrounding the food particle with its pseudopodia. The undigested food which is largely carbon dioxide gas is expelled outside by the vacuole. While in human beings, the food (which is complex substance) is taken inside the mouth and undergoes a complex process of digestion and absorption. Finally the undigested food it expelled in the form of faeces.

Q 11:

Match the items of **Column** I with suitable items in **Column II**

Column I	**Column II**
(a) Salivary gland	(i) Bile juice secretion
(b) Stomach	(ii) Storage of undigested food
(c) Liver	(iii) Saliva secretion
(d) Rectum	(iv) Acid release
(e) Small intestine	(v) Digestion is completed
(f) Large intestine	(vi) Absorption of water (vii) Release of faeces

Ans 11:

Column I	Column II
(a) Salivary gland	(iii) Saliva secretion
(b) Stomach	(iv) Acid release
(c) Liver	(i) Bile juice secretion
(d) Rectum	(vii) Release of faeces
(e) Small intestine	(v) Digestion is completed
(f) Large intestine	(vi) Absorption of water (ii) Storage of undigested food

If you want chapter wise NCERT Solutions for class 7 Science in English then Link given below.

CHAPTER NO.	CHAPTER NAME
1	Nutrition in Plants
2	Nutrition in Animal
3	fiber to Fabric
4	Heat
5	Acids, bases and Salts
6	physical and Chemical changes
7	Weather, Climate and Adaptations of Animals to Climate
8	Winds, Storms and Cyclones
9	Soil
10	Respiration in Organisms
11	Transportation in Animals and Plants
12	Reproduction in Plants
13	Motion and Time
14	Electric Current and its Effects
15	Light
16	Water: A Precious Resource
17	Forests : Our Lifeline
18	Waste water Story
