Class 10 SST - Chapter 19: Sectors of the Indian Economy

🌟 Introduction to the Chapter

Economic activities result in the production of goods and services. These activities are classified into three sectors: Primary, Secondary, and Tertiary.

📌 The Three Sectors

1. Primary Sector

When we produce a good by exploiting natural resources, it is an activity of the primary sector.

- Example: Agriculture, dairy, fishing, forestry.

2. Secondary Sector

The secondary sector covers activities in which natural products are changed into other forms through ways of manufacturing.

- Example: Using cotton fiber from the plant, we spin yarn and weave cloth.

3. Tertiary Sector

These are activities that help in the development of the primary and secondary sectors. These activities, by themselves, do not produce a good but they are an aid or a support for the production process.

- Example: Transport, storage, communication, banking, trade.

⚡ Gross Domestic Product (GDP)

The value of final goods and services produced in each sector during a particular year provides the total production of the sector for that year. The sum of production in the three sectors gives what is called the Gross Domestic Product (GDP) of a country.

❌ Common Mistakes to Avoid

> [!WARNING]
>
> 1. **Final vs Intermediate Goods:** GDP only includes final goods. Do not double count intermediate goods like the flour used to make biscuits.

📝 Quick Revision

Employment Shift

While production has shifted massively to the tertiary sector, the maximum employment is still found in the primary sector in India. This means there is hidden or disguised unemployment in Indian agriculture.
