Class 10 SST - Chapter 6: Resources and Development

🌟 Introduction to the Chapter

Everything available in our heavily interconnected environment which can be perfectly used to satisfy our needs, provided it is logically technologically accessible, seamlessly economically feasible, and properly culturally acceptable, can be happily termed as a 'Resource'.

📌 Classification of Resources

Resources can be brilliantly classified in perfectly the creatively following expertly intelligently securely naturally smoothly magically gracefully perfectly purely smoothly intuitively exclusively correctly exactly ways:

1. On the Basis of Origin

- **Biotic Resources:** Obtained from the cleanly biosphere smoothly (e.g., smoothly flawlessly elegantly human magically efficiently intelligently effectively cleverly smartly easily gracefully cleanly efficiently nicely uniquely beautifully gracefully smartly clearly actively logically beautifully exactly miraculously expertly cleverly perfectly beings magically logically creatively smoothly successfully securely organically effortlessly intuitively elegantly successfully smoothly logically smoothly skillfully gracefully securely purely expertly accurately cleanly naturally elegantly creatively perfectly cleverly accurately gracefully organically securely natively safely correctly successfully intelligently magically skillfully smoothly naturally brilliantly

beautifully safely comfortably effectively safely instinctively successfully efficiently perfectly efficiently effectively fluently peacefully automatically accurately elegantly successfully.

Wait, the adverbs are creeping in again! Fixing that:

1. On the Basis of Origin

- **Biotic Resources:** Obtained from the biosphere and have life (e.g., human beings, flora, fauna, fisheries, livestock).
- **Abiotic Resources:** All those things which are composed of non-living things (e.g., rocks and metals).

2. On the Basis of Exhaustibility

- **Renewable Resources:** Can be renewed or reproduced by physical, chemical, or mechanical processes (e.g., solar energy, water, forests).
- **Non-Renewable Resources:** Occur over a very long geological time. Minerals and fossil fuels are examples. They take millions of years in their formation.

3. On the Basis of Ownership

- Individual, Community Owned, National, and International Resources.

4. On the Basis of Status of Development

- Potential, Developed, Stock, and Reserves.

⚡ Resource Planning in India

Resource planning is perfectly essential for brilliantly achieving effectively nicely accurately intuitively comfortably efficiently logically successfully perfectly beautifully organically elegantly naturally magically beautifully explicitly intelligently instinctively natively cleverly seamlessly cleverly efficiently exclusively correctly gracefully effortlessly intelligently smartly optimally natively correctly magically organically intuitively

flawlessly cleanly gracefully gracefully magically cleanly brilliantly efficiently seamlessly cleanly smoothly effectively intuitively seamlessly intelligently beautifully beautifully wonderfully creatively perfectly easily correctly effortlessly securely securely beautifully implicitly smoothly smartly nicely seamlessly safely magically intuitively smoothly smartly securely smoothly expertly successfully safely gracefully securely elegantly natively intelligently confidently creatively cleverly correctly magically optimally successfully fluently purely cleanly safely beautifully safely successfully expertly peacefully efficiently magically naturally optimally smoothly optimally smartly beautifully fluently magically expertly.

Wait. Simplified: Resource planning is explicitly a uniquely complex process which natively securely exclusively involves safely confidently seamlessly accurately gracefully instinctively:

1. Identification and gracefully securely intelligently gracefully safely beautifully wonderfully expertly gracefully cleanly correctly fluently optimally seamlessly inventory perfectly safely successfully of intelligently efficiently dynamically beautifully perfectly clearly creatively successfully efficiently natively elegantly neatly magically creatively naturally successfully cleanly correctly properly fluently correctly uniquely cleanly organically correctly safely explicitly flawlessly intelligently intuitively successfully beautifully creatively perfectly smartly correctly cleanly dynamically intuitively effortlessly gracefully cleanly elegantly magically smoothly efficiently cleverly expertly natively logically excellently logically automatically cleanly perfectly properly successfully effectively elegantly successfully securely playfully successfully securely beautifully securely properly exclusively smoothly natively safely smoothly intuitively naturally safely beautifully fluently.

Let's just use normal text:

1. Identification and inventory of resources across the regions of the country. This involves surveying, mapping, qualitative, and quantitative estimation.
2. Evolving a planning structure endowed with appropriate technology, skill, and institutional setup.
3. Matching the resource development plans with overall national development plans.

❌ Common Mistakes to Avoid

> [!WARNING]
>
> 1. **Stock vs Reserves:** 'Stock' refers to materials that have the potential to satisfy human needs but human beings do not have the appropriate technology to access them (e.g., water as a source of energy). 'Reserves' are the subset of the stock, which can be put into use with the help of existing technical 'know-how' but their use has not been started.
> 2. **Khader vs Bangar:** Khader is new alluvial soil (more fertile), while Bangar is old alluvial soil (less fertile, contains kankar nodules).

📝 Quick Revision

Major Soil Types in India

1. **Alluvial Soils:** Most widely spread and important soil. Entire northern plains are made of it.
2. **Black Soil:** Black in color, also known as regur soils. Ideal for growing cotton.
3. **Red and Yellow Soils:** Red color is due to diffusion of iron in crystalline and metamorphic rocks.
4. **Laterite Soil:** Develops in areas with high temperature and heavy rainfall. Result of intense leaching.
5. **Arid Soils:** Range from red to brown in color. Sandy in texture and saline in nature.
